Hearing deal a winner

MELBOURNE company Dynamic Hearing has developed new technology that promises improved sound for the hearing impaired.

"Digital technology, software embedded into hearing aids, helps people hear in noisy settings like an airport," said chief executive of Dynamic Hearing, Dr. Elize Saunders.

"There are many digital hearing aids available but they have not been able to compete with the analogue sound quality of hearing aids," she said.

"Our technology is designed to be better than the existing hearing aids in terms of sound quality and comfort," Dr. Saunders said.

"We have developed a unique digital signal processing algorithm that improves the clarity of the sound, making it easier for people with hearing loss to understand speech in noisy environments," she added.

"We are excited to introduce this new technology to the market and help more people with hearing loss to hear clearly and comfortably," Dr. Saunders said.

"Our goal is to make hearing aids more affordable and accessible to everyone who needs them," she said.

"We believe our technology will be the future of hearing aids," Dr. Saunders said.

"Our technology is a game-changer and we are proud to be at the forefront of this exciting development," she said.

"We are looking forward to working with our partners and customers to bring this technology to market," Dr. Saunders said.

"We are confident that our technology will have a positive impact on the lives of people with hearing loss," she said.

"We are excited to see the positive feedback we receive from our customers," Dr. Saunders said.

"Hearing aids are a key component of our overall hearing health plan," she said.

"We are committed to providing our patients with the best possible hearing solutions," she said.

"We believe our technology will be a game-changer in the hearing aid industry," Dr. Saunders said.
